Urban Street Symposium 5
Closing Session

Performance-Based Analysis of Geometric Design of Highways and Streets

Research Progress and “Opportunities”

R.J. Porter, PhD, PE

VHB

Raleigh, NC

USS5 Design-Related Themes

Complete streets/design for all users

Space constraints, fiscal constraints

Safety

Importance of non-transportation outcomes (e.g., economic development, healthy communities, social interaction)

Flexibility to adapt to specific context

Characteristics of Performance-Based Analysis

Objective outcomes of alternative design decisions are quantified/
predicted and used to inform decisions

Level of analysis detail is consistent with project development stage

Performance measures are linked to broader intended project
outcomes and societal goals

Requires knowledge of direct and indirect impacts of design on
performance

Recent Design “Process” Research

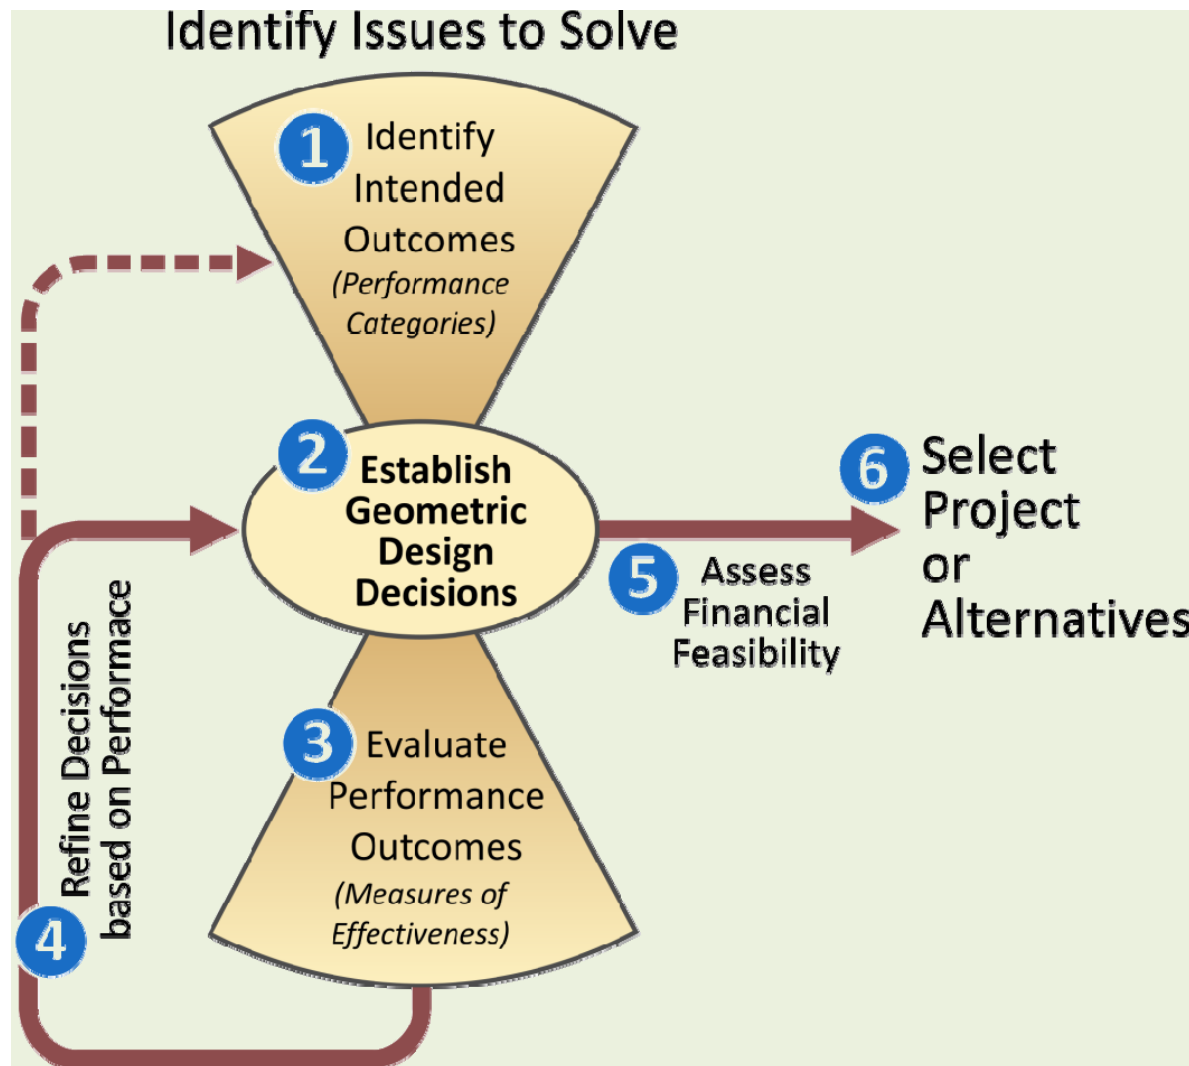

Offer new/ revised ways for designers to think about...

Context

Context	Rural	Rural Town	Suburban	Urban	Urban Core
Principal Arterial	H speed H mobility-L access	L/M speed M mobility-H access	M/H speed M mobility-H access	L/M speed M mobility-M access	L speed M mobility-M access
	LC: L separation; NC: M separation; CC: H separation	LC: L separation; NC, CC: M separation	LC: L separation; NC: M separation; CC: H separation	LC: L separation; NC: M/H separation; CC: H separation	LC: L separation; NC, CC: M separation
	P1: *; P2: Min; P3, P4: Wide	P2: Min; P3: Wide; P4: Enhanced	P1: *; P2: Min; P3, P4: Wide	P2: Min; P3: Wide; P4: Enhanced	P3: Wide; P4: Enhanced

Local	M speed M mobility-M access	L speed M mobility-H access	L speed L mobility-H access	L speed L mobility-H access	L speed L mobility-H access
	LC, NC, CC: L separation	LC, NC, CC: L separation	LC, NC, CC: L separation	LC, NC, CC: L separation	LC, NC, CC: L separation
	P1, P2: Min; P3, P4: Wide	P2: Min; P3: Wide; P4: Enhanced	P1: *; P2: Min; P3, P4: Wide	P2: Min; P3: Wide; P4: Enhanced	P3: Wide; P4: Enhanced
Speed, Mobility, Accessibility, and Separation Levels -- H: High; M: Medium; L: Low					
Bicycle Connectors -- LC: Local; NC: Neighborhood; CC: Citywide					
Pedestrian Traffic Levels -- P1: rare/occasional; P2: low; P3: medium; P4: high					
Pedestrian Facility Width -- *: site-specific considerations; Min: minimum; Wide: greater than minimum; Enhanced: wide for large congregating pedestrian groups. Pedestrian facility separation should be considered in conjunction with driver target speeds.					

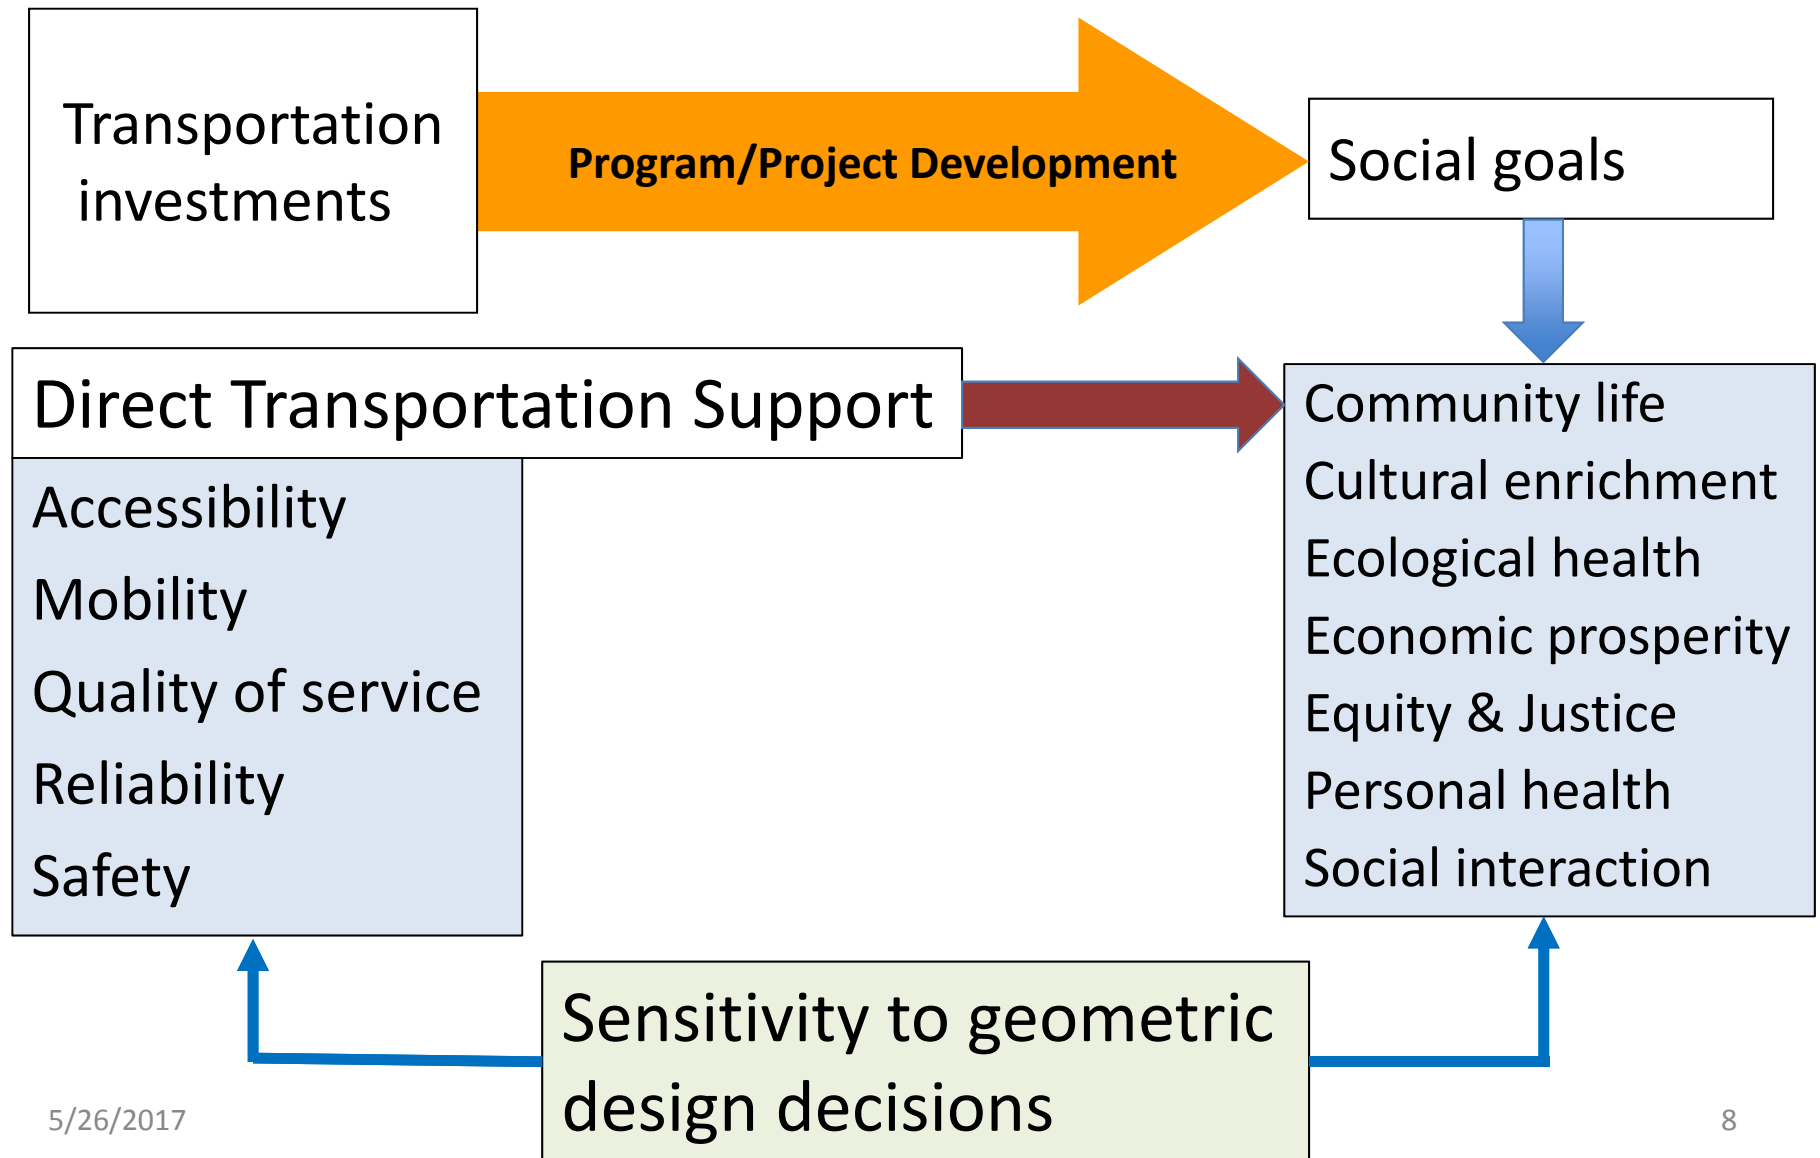

From Stamatiadis et al., Pre-publication draft of
NCHRP Report 855

Design Decision-Making

From Ray et al., NCHRP Report 785

Geometric Design Performance

Hauer (2005) – The Road Ahead

The Rational Style

Automatic to a more rational style
hungry for factual knowledge.

With Safety defined as...

The number of crashes, or crash consequences, by
and severity, expected to occur on the entity during a
specified period

NCHRP 20-07/Task 394 [Active]

Development of Performance-Based Geometric Design Content for the Next Edition of the AASHTO Green Book

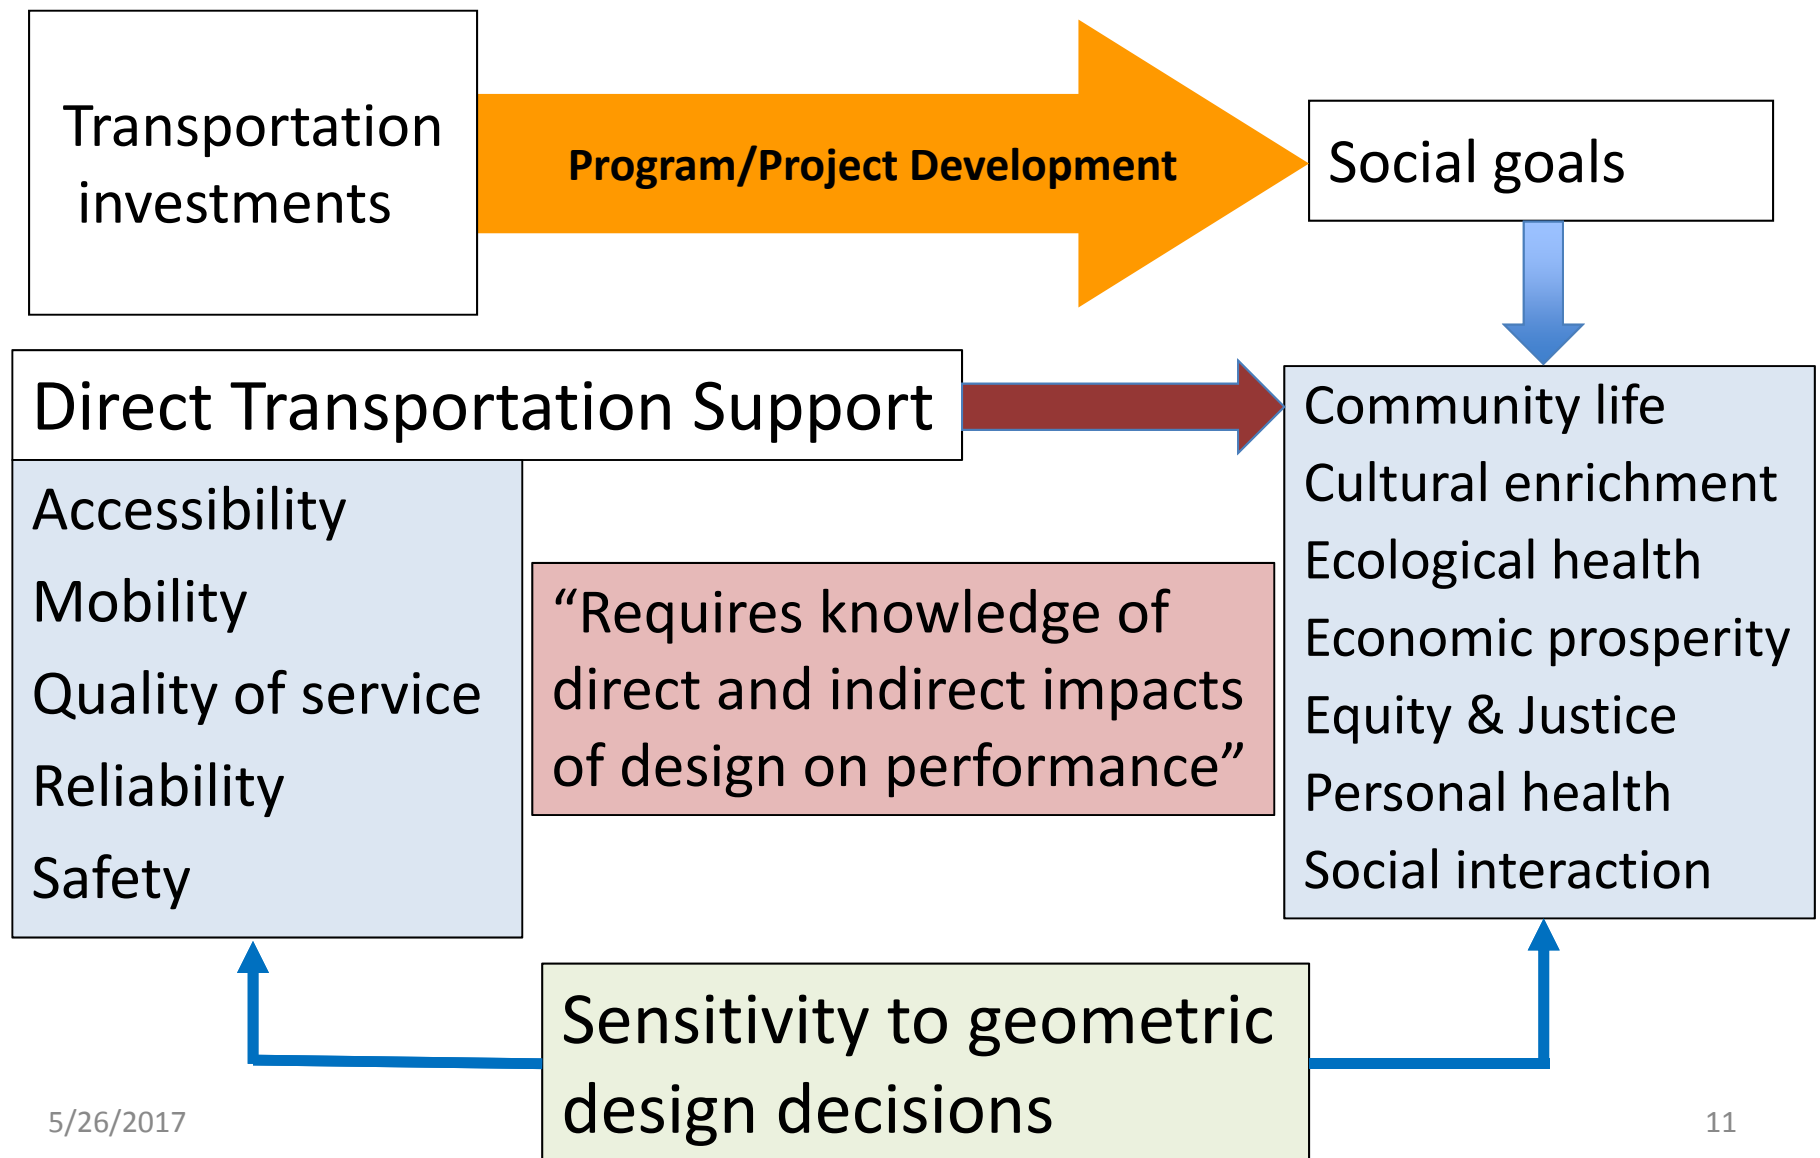

<http://apps.trb.org/cmsfeed/TRBNetProjectDisplay.asp?ProjectID=4093>

provide recommended content changes for the AASHTO Green Book based on the AASHTO *Highway Safety Manual*; NCHRP Report Number 785; and other relevant research

primary content change should be an introduction to and overview of the concept of performance-based design

“Opportunity” 1: Knowledge Generation and Management

“Opportunity” 1: Knowledge Generation and Management

Illustrative example from Ray et al., NCHRP Report 785

Intersection Geometric Elements/Characteristics	Accessibility	Mobility	Quality of Service	Reliability	Safety
Intersection form-control type and	◊	*	*	x	*
Information for control type and					
Access					
Control					
Bicycle accommodation facilities	●	●	●	□ ^x	● ^x
Curve tapers and radii	● ^x	● ^x	● ^x	□ ^x	● ^x
Design vehicle accommodations	□ ^x	□ ^x	□ ^x	□ ^x	□ ^x
Intersection sight distance	● ^x	● ^x	● ^x	□ ^x	● ^x
Lane widths	● ^x	● ^x	● ^x	□ ^x	● ^x
Median opening configuration	●◊	●◊	●◊	□ ^x	● ^x
Number and types of lanes	●◊	●*	●*	□ ^x	●*
Particular					
Surface					
Signaling					
(interference)					
Shoulder width and composition	● ^x	● ^x	● ^x	□ ^x	● ^x
Traffic islands	● ^x	● ^x	● ^x	□ ^x	● ^x
Horizontal alignment of approaches	● ^x	● ^x	● ^x	□ ^x	●*
Vertical alignment of approaches	●◊	●*	●*	□ ^x	●*

How to we manage and prioritize data and information to make performance-based analysis practical and cost-effective?

What do we do when need for information on “performance effects” outpaces its availability?

- = direct effect
- = indirect effect
- = no effect
- * = relationship can be directly estimated by existing performance prediction tools
- ◊ = relationship can be indirectly estimated using more than one existing tool
- x = relationship cannot be estimated by existing tools

Accessibility & Reliability

What are the mechanisms by which design decisions impact accessibility? Reliability?

P-Value <	0.005
Mean	22.737
StDev	3.631
Variance	13.185
Skewness	1.02811
Kurtosis	2.26916
N	100000
Minimum	13.557
1st Quartile	20.195
Median	22.232
3rd Quartile	24.692
Maximum	58.516

What data and tools are needed for designers to analyze accessibility? Reliability?

3.615	3.647
-------	-------

Impact of geometric decisions

“Opportunity” 3: Addressing the Complexity of Safety Performance

Example SDEs - Urban 4-leg Signalized Intersections

What do the next generations of safety models need to look like to more fully address urban street design alternatives?

$$N_{bimv} = \exp(a + b \times \ln(AADT_{maj}) + c \times \ln(AADT_{min}))$$

Does model development have to be driven by statistical regression models? Can we build on experience and individual projects in a quantitative/objective way?

$$N_{bike} = (N_{bimv} + N_{bisv}) \times f_{bikei}$$

Questions/Comments?
